

arr = [3, 1, 2]

↳ permutations $\Rightarrow 3! = 6$.

(2) 321
 123
 next permutation

- 1 2 3
- 1 3 2
- 2 1 3
- 2 3 1
- 3 1 2
- 3 2 1

(1) For 312
 next permutation is 321.

→ Naive Soln:
 → generate all permutations
 → perform linear search. [for finding 312]. $\Rightarrow O(N! \times N)$
 → next index will be the answer. //

→ optimal soln:

[2, 1, 5, 4, 3, 0, 0]

→ match every time's

↳ 2 | 5 4 3 0 0

→ 2 1 5 4 3 0 0

→ 2 1 5 4 3 0 0

→ 2 1 5 4 - - -

→ 2 1 5 - - - -

→ 2 1 - - - -

003
 030 } both are smaller than 300

3400 - < less
 4030 → less than 4300
 4300 → equal

54300
 53400
 5 - -

won't give any
 soln, highest is
 below 5. Then won't be
 any this ie 75.

(1) Ray } longest prefix match
 Ra x } J & X
 Rb x } → Ra x appear
 after Ray in dictionary

2 3 4 min

the rest of part can be drawn out by sorting or reversing the part.

\Rightarrow we can say that clearly the elements are greater than the before elements.

$$5 > 4, 4 > 3, 3 > 0$$

so we got 1

$$1 < 5$$

\therefore we can swap these elements.

Step \rightarrow ①

②

Find index at which the array is pivoted.

③

check if array is sorted based on

index

④

check the min of array value

from right side
 $a[i] < a[i+1]$

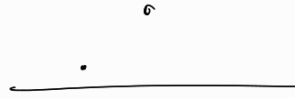

it
index == -1

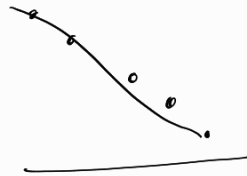

[1, 2, 3, 4 | 5]

[5, 4, 3, 2, 1]

④ reverse the array

⇒  index found

No index ⇒ -1.

so reverse it

⇒ as it's the biologically
the biggest one.
